Stage One - Out With the Old

This UK Power Station removed old fashioned concrete and steel covers that were now severely damaged and replaced them with Fibrelite's lightweight Trench Access Covers. Previously, a forklift and lifting equipment had to be used every time one of the old covers needed to be removed, a costly and time consuming exercise. Now a single person can easily and safely remove the Fibrelite covers, a refreshingly simple and inexpensive task.

As you can clearly see from the images, the tired, cracked and crumbling concrete and bowed rusting steel covers have not only seen better days, but are causing on site health and safety issues. All these hazards are to be eliminated with our non-corrosive, non-cracking, slip resistant and incredibly strong composite trench panels.
Next Stage - Installation of Fibrelite's Composite Trench Access Covers

Fibrelite has supplied 7.2m of 1m long trench access covers (D400 load rating). This is for installation in to the road leading to a forklift loading area and where ash removal HGV's are frequently loaded.

**Customer Quote:** "We were looking for an installation to replace our ageing duct covers. Fibrelite came up with this solution and it is manufactured and sourced locally."

**Summary of Composite Benefits Versus Steel and Concrete:**
- Composite is lightweight, strong and unlike concrete will not crumble or crack
- Specially designed lifting aid eliminates back injury and crushed fingers
- Non metallic, non-conductive and will not spark
- Excellent insulator against heat
- Unaffected by underground gasses and most chemicals
- Incredibly strong monolithic structure that will not delaminate
- Treads incorporate a specialised anti-slip material equivalent to modern high grade road surface
- Range of UV stable colours available that will not flake or crack
